1 aris

Poor Ares reserve processor's RIS to AutoHotkey converter in javascript with help from mustache.js.

The AutoHotkey template is customized for my workplace.

Aris produces two types of AutoHotkey for RIS with type BOOK or JOUR. BOOK is for Ares's monograph template and JOUR for the serial.

1.1 Installation

1. Go to the home page for Aris (<https://github.com/trauber/aris>).
2. Click the **Downloads** icon over on the right side of the page.
3. Download the **.zip** archive.
4. Right mouse click on the **.zip** archive.
5. Extract all files. The folder can go anywhere convenient for you, but I suggest the desktop.

1.2 Usage

1. Click the **aris.html** icon so it opens in your web browser. (Your browser should have javascript enabled.)

2. "Export" (download) an RIS file from a database. (Configure your browser to open **.ris** files in notepad.)
3. Use **Ctrl-a** and **Ctrl-c** to copy the record in notepad.
4. Paste the record into aris's textarea with **Ctrl-v**.
5. Click aris's **convert RIS to AutoHotkey** button.
6. Use **Ctrl-a** and **Ctrl-c** to copy the AutoHotkey script.
7. In notepad use **Ctrl-a** and **Ctrl-v** to replace the RIS record with the AutoHotkey script.
8. In notepad save the file with a **.ahk** extension. (Again, your desktop is the best place.)
9. Open the add item button in Ares, select your template.
10. Double click the **.ahk** icon to export the bib info into Ares.
